

The Volusion Payments Infrastructure

Volusion's payments stack is built on a best-in-class, proven digital and card-not-present Payments Orchestration platform (provided by [Spreedly](#)) that brings a value-filled, secure, and flexible payments strategy to our customers while freeing up developer bandwidth.

More Value

Using a Payments Orchestration platform allows us to provide payment services like account updating and network tokens to refresh cards and keep customers transacting. Plus, smart routing and failover technology helps avoid downtime, increasing your top-line revenue.

Flexible Options

Our service includes standardized integrations to over 120+ payment processors and gateways, as well as over 100+ transparent gateway (proxy-forwarding) integrations to secure third party providers to support routing optimization and other payments scaling needs.

Security and Compliance

Payments Orchestration helps Volusion stay secure and comply with payment security regulations (ex: PCI DSS, via a PCI level 1 processor-agnostic payment vault and tokenization service). This means that both your data and your customers' data is vaulted and safe.

Features & Functionality

Our investment in Payments Orchestration enables access to hundreds of payment services from a single API. This means our developers are focused on adding more features and functionality for you rather than having to build and maintain payments integrations.
